Artist Statement

For this Data Visual, we were inspired in either creating a spontaneous rain effect, or one similar to waves. We used the metro, counter, pipe and * objects. We also have toggle feature where the viewer can manipulate the direction of the pattern being displayed. The metro controls the direction of the relay of information through the slider. The pipe object helped us create a push delay from the data input. The sliders have a counter that has a range of up to 127. The challenges we faced consisted of not being able to make the sliders move in a downward motion on there own so we ended up manipulating the physical colors of the background and slider information to simulate the visual of a mirror image. We liked the clean lines of a white on black visual.
